

1-15

Since $f(n) = n^2 + 3n^3$, we consider $h(n) = n^3$. By definition, we can find $c_1 = 3$, $c_2 = 4$, and $N = 1$ such that $c_1 \cdot h(n) \leq f(n) \leq c_2 \cdot h(n)$ holds. We verify as follows:

$$f(n) = n^2 + 3n^3 \leq 4n^3 = O(n^3) \text{ if } n \geq N = 1 \quad \text{and}$$

$$f(n) = n^2 + 3n^3 \geq 3n^3 = \Omega(n^3) \text{ if } n \geq N = 1$$

That is, $f(n)$ is in both $O(n^3)$ and $\Omega(n^3)$

1-16

To show $T(n) = 6n^2 + 20n = O(n^2)$, by definition, we can find $C = 1$ and $N = 9$ such that $6n^2 + 20n < n^3$ if $n \geq N = 9$. Thus, $T(n) \in O(n^2)$

For proving $T(n) \notin \Omega(n^2)$, we need to show that for any given positive constant C , there exists an integer $N > 0$ such that $T(n) < C \cdot g(n)$ when $n \geq N$.

We consider $T(n) = 6n^2 + 20n$ and $g(n) = n^2$. Then, for any given constant $c > 0$, we choose N

$$N = \begin{cases} \lceil \frac{9}{c} \rceil, & \text{if } 0 < c < 1 \\ 9, & \text{if } c \geq 1 \end{cases}$$

It's easy to verify that $6n^2 + 20n < C \cdot n^2$ if $n \geq N$. Thus, $6n^2 + 20n \notin \Omega(n^2)$

1-18

To show $g(n) = 5n^5 + 4n^4 + 6n^3 + 2n^2 + n + 7 \in \Theta(n^5)$, by definition, $c \cdot n^5 \leq g(n) \leq d \cdot n^5 \Rightarrow c = 5, d = 6$.

Then $6n^5 \geq 5n^5 + 4n^4 + 6n^3 + 2n^2 + n + 7 \Rightarrow n^5 \geq 4n^4 + 6n^3 + 2n^2 + n + 7 \Rightarrow N = 6$.

Thus, $5n^5 + 4n^4 + 6n^3 + 2n^2 + n + 7 \in \Theta(n^5)$

1-22

$$n^n = n^n + \lg n > 2^{n!} > 10^{n^{20}} > 4^n > e^n > (\lg n)! > n! > n^{5/2} > 5^{\lg n} > 5n^2 + 7n > (\lg n)^2 > n \lg n \\ = \lg(n!) > 8n + 12 > \sqrt{n}$$
